

Abstract

Camera, camera system and method of operating same

5 (Figure 1)

A device for resetting the CCD sensor unit 3 is provided for a camera comprising a CCD sensor unit 4 and a shutter 3 in the imaging beam path. This device for resetting the CCD sensor
10 unit 3 comprises a control unit 5 which resets the CCD sensor unit with a time delay and/or with time monitoring after the opening of the shutter. Two or more such cameras can be combined to form a camera system for recording images which are matched to one another in time. A method is specified for op-
15 eration of a camera and a camera system, in which the CCD sensor unit is in this case reset after opening of a mechanical shutter 3 in the imaging beam path.
